1. Topic: Digital Privacy, Mass Surveillance, and Geolocation Data
    - **Title**: Mass Location Data Harvesting in Consumer Apps: The Erosion of Everyday Anonymity.
    - **Source**: Electronic Privacy & Technology Law Quarterly (March 2nd, 2025)
    - **URL**: https://www.eptlquarterly.org/articles/2025/location-data-privacy-surveillance

2. Topic: Social Media Algorithms, Echo Chambers and Democratic Integrity
    - **Title**: Algorithmic Amplification of Polarization in the 2025-2026 Global Election Cycles.
    - **Source**: Journal of Information Society and Democracy (May 19th, 2025)
    - **URL**: https://www.jisd-journal.org/2025/algorithmic-polarization-elections

3. Topic: Censorship, Free Expression, and Online Harm Mitigation
    - **Title**: Platform Moderation vs. Free Speech: Navigating Constitutional Boundaries in Digital Public Squares.
    - **Source**: First Amendment & Digital Freedom Review (July 11th, 2025)
    - **URL**: https://www.firstamendmentdigital.org/2025/platform-moderation-free-speech

4. Topic: Environmental Impact of Technological Infrastructure
    - **Title**: The Invisible Carbon Footprint of Generative AI. Energy, Water and Infrastructure Demands
    - **Source**: Global Environmental Science & Technology (September 28th, 2025)
    - **URL**: https://www.gest-journal.org/2025/generative-ai-environmental-footprint

5. Topic: Cryptocurrencies, Blockchain Consensus, and Energy Ethics
    - **Title**: Proof of Stake vs. Proof of Work: Assessing Energy Consumption and Centralization Risks in Modern Blockchains.
    - **Source**: Financial Technology & Ethics Digest (November 15th, 2025)
    - **URL**: https://www.fintechethicsdigest.org/2025/blockchain-consensus-energy-ethics

6. Topic: Generative AI, Intellectual Property and Creative Labor
    - **Title**: Copyright, Training Data and the Exploitation of Creative Labor in Large Generative Models.
    - **Source**: Intellectual Property & Digital Rights Review (January 10th, 2026)
    - **URL**: https://www.ipdigitalrights.org/2026/copyright-training-data-creative-labor

7. Topic: Networked Communications, Spam and Botnet Infrastructure
    - **Title**: The Evolution of Automated Email Spam and AI-Driven Phishing Campaigns
    - **Source**: Cybersecurity & Socio-Technical Systems Journal (March 22, 2026)
    - **URL**: https://www.csts-journal.org/2026/automated-spam-phishing-evolution

8. Topic: Deepfakes, Misinformation, and the Breakdown of Digital Trust
    - **Title**: Synthetic Media and the Epistemic Crisis: Safeguarding Public Information in the Deepfake Era
    - **Source**: Media Ethics & Digital Information Quarterly (June 8th, 2026)
    - **URL**: https://www.mediadethicsquarterly.org/2026/synthetic-media-deepfakes-epistemic-crisis

9. Topic: Cyberbullying, Online Harms and Digital Responsibility
    - **Title**: Socio-Technical Approaches to Mitigating Online Harassment and Image-based Abuse
    - **Source**: Digital Safety & Behavioral Ethics Journal (August 14th, 2026)
    - **URL**: https://www.digitalsafetyjournal.org/2026/mitigating-online-harassment-abuse

10. Topic: Computer System Reliability, Software Failures, and Professional Responsibility
    - **Title**: Safety Critical AI Systems in Medical Diagnostics: Accountability and System Reliability Risks.
    - **Source**: Journal of Healthcare Technology & Professional Ethics (September 12, 2026)
    - **URL**: https://www.jhtpe.org/2026/safety-critical-ai-medical-reliability

# Summaries

## Digital Privacy, Mass Surveillance and Geolocation Data

This investigation shows how everyday mobile apps secretly collect and sell users' locations to data brokers. Firms package these raw data into behavioral files that exposes information on visits to medical clinics, places of worship and private homes. While app developers claim data collected is masked, the researchers proved that simple location matching tools can link the location back to the individual.

From a Social Contract standpoint, constant tracking destroys privacy by forcing users to give up their location data for basic access on the app. As people, we expect freedom from surveillance by companies and making data harvesting a breach of data privacy. Through Virtue Ethics, tech firms using deceptive tactics show a clear lack of integrity, honesty and respect for user freedom.

## Social Media Algorithms, Echo Chambers and Democratic Integrity

The study shows how engagement-based algorithms push extreme divisive material to keep users active online. By examining platform traffic across global elections, they demonstrated how algorithms trap voters inside partisan echo chamber. Rather that being neutral, social platforms actively manipulate the public by promoting outrage over factual reporting.

Applying Act Utilitarianism to social media engagement highlights a moral failure where short-term ad revenue causes extreme political hostility. The financial perks gained by platform owners are outweighed by the widespread social harm done to democratic civil discourse.

## Environmental Impact of Technological Infrastructure

This paper outlines the massive environmental damages of building, training and deploying large scale AI models. Training one model demands a lot of electricity and consumes millions of gallons of cooling water. This shows a gap between tech leaders' carbon-neutral promises and their actual infrastructure. This unlimited expansion of data centers accelerates global carbon emissions while draining necessary local drinking water supplies in communities with droughts.

With Rule Utilitarianism, accepting a rule that allows tech companies access to unlimited natural resource consumption is completely unsustainable. If all global industry grew its power and water usage rapidly, sped up climate collapse would inflict severe economic harm worldwide.

## Cryptocurrencies, Blockchain Consensus and Energy Ethics

This paper shows the technical and ethical tradeoffs of Proof of Work and Proof os Stake consensus systems in digital currencies. While Proof of Work gives strong network security and decentralization, its heavy mining operations uses too much electricity on a large scale. Moving to Proof of Stake cuts energy usage to 99% by replacing computing power with financial token deposits. However, Proof of Stake creates concerns by handing control of the network to wealthy token holders which can cause distrust between them and ordinary token holders.

Examining Proof of Work using Act Utilitarianism shows the demand for electricity fails to deliver a positive global outcome. Burning hours of electricity for crypto causes climate harm that quite outweighs localized financial profits earned by miners. On the other hand, Proof of Stake through Social Contract Theory shows serious equity issues regarding wealth collection.

# Computer System Reliability, Software Failures and Professional Responsibility

This report shows the integration of automated AI software across high-risk emergency environments. By showing real world software glitches and unverified system updates, they highlighted dangerous gaps in corporate accountability. Software companies use legal declaimers to push liability on hospital staff, even if doctors rely heavily on these outputs. This report demands mandatory safety testing, consistent verification standards and legal accountability for software firms building life-critical tools.

According to Kantianism, an engineer’s duty of care is directly violated when unproven medical software is used without safety assessments. Patients and medical professionals and treated as tools for financial gain by tech companies pushing untested updates to the market.
